# Conversion Factors Needed for Common Fertilizer Calculations 

Authored by Mark Reiter, Associate Professor and Extension Soils and Nutrient Management Specialist, Eastern Shore Agricultural Research and Extension Center, Virginia Tech

## Introduction

The world is a big place and farmers, industry, government, and others likely use different units, oxidation states, and measurements when calculating and reporting nutrient use for farming systems. The following table outlines some of the most common conversions needed for nutrient management. For instance, to convert $\mathrm{K}_{\text {to }} \mathrm{K}_{2} \mathrm{O}$, you would multiply your K number by 1.2051 . So, a fertilizer being reported as $49.8 \% \mathrm{~K}$ is also commonly reported as $49.8 \% \times 1.2051=60 \% \mathrm{~K}_{2} \mathrm{O}$. Therefore, you are equally correct to report muriate of potash ( KCl ) fertilizer as $49.8 \% \mathrm{~K}$ or $60 \% \mathrm{~K}_{2} \mathrm{O}$, as long as you have the correct unit represented. However, note that fertilizer law generally states that certain oxidation states should be reported for certain nutrients (i.e. $\mathrm{K}_{2} \mathrm{O}$ must be used on Virginia fertilizer labels).
